

Assets

- Nuxt offers two options for our assets.
- Nuxt uses two directories to handle assets like stylesheets, fonts or images.
 - ◆ The 📁 public/ directory.
 - ◆ The 📁 assets/ directory.

Public Directory

- The public/ directory is used as a public server for static assets publicly.
- We can get a file in a browser by the root URL /.
- Files are served at the root and are not modified by the build process.
- Suitable for files that have to keep their names (e.g. robots.txt) or likely won't change (e.g. favicon.ico).
- This is known as the static/ directory in Nuxt 2.
