

# Pages & Routing

- Nuxt provides file-based routing to create routes within our web application.
- Nuxt will automatically create a route for every page in our `~/pages/` directory.

# Pages & Routing

```
| pages/  
---| about.vue  
---| index.vue  
---| posts/  
-----| [id].vue
```

```
{  
  "routes": [  
    {  
      "path": "/about",  
      "component": "pages/about.vue"  
    },  
    {  
      "path": "/",  
      "component": "pages/index.vue"  
    },  
    {  
      "path": "/posts/:id",  
      "component": "pages/posts/[id].vue"  
    }  
  ]  
}
```

# Pages & Routing

- Pages are Vue components and can have any valid extension that Nuxt supports (by default `.vue`, `.js`, `.jsx`, `.mjs`, `.ts` or `.tsx`).
