Assets Directory

➜ The assets/ directory is used to add all the website's assets that the build tool will process.

➜ The directory usually contains the following types of files:

- ◆ Stylesheets (CSS, SASS, etc.)
- ◆ Fonts
- ◆ Images that won't be served from the public/ directory.

Assets Directory

➡ We should use the public/ directory if we want to serve assets from the server.

➡ We can reference a file located in the assets/ directory by using the ~/assets/ path.
